

Hey students, let's dive into the world of REST APIs! REST (Representational State Transfer) is an architectural style that guides how web services communicate. With REST APIs, you can perform operations like creating, reading, updating, and deleting data using standard HTTP methods (GET, POST, PUT, DELETE). This makes building and scaling web applications simpler and more efficient.

For a practical look at REST APIs, check out [this Postman blog post on REST API examples](#). It's filled with real-world examples that show you how these concepts work in practice.
