

The task for this week is the following.

PART 1

Do some research on the main differences between SQL Server and MySQL, and between SQL Server and PostgreSQL.

What are the main advantages of using SQL Server compared to its competitors?

What are the differences in syntax and semantics?

Take note of the most important elements and make sure you keep these notes.

Some questions about this might be present in the computer-based test (CBT) in a few weeks.

Time to complete: 1 hour.

PART 2

Do some research on cartesian product and the different types of JOIN available in SQL Server (the book can be a useful resource in this case).

Understand the differences and think about some examples where using the cartesian product or the different types of JOIN would lead to different results.

Again, take note of the most important elements and make sure you keep these notes.

Some questions about this might be present in the computer-based test (CBT) in a few weeks.

Time to complete: 2 hours
